

Based on the insights from the jury members, here are **AI + Low-Code app ideas** you could build with **OutSystems** to address real-world, business-critical internal processes. These ideas align with the hackathon theme and focus on speed, cost-efficiency, and innovation:

1. AI-Powered Resource Planning & Talent Allocation App

Problem: Inefficient resource forecasting and talent utilization.

Solution:

- Use AI to predict project resource needs based on historical data.
- Automate talent matching based on skills, availability, and workload.
- Integrate with HR systems to track capacity and suggest reallocation.

OutSystems Features: Workflow automation, dashboards, integration with HR APIs.

AI Use: Predictive analytics, NLP for parsing resumes and project descriptions.

2. Gamified Onboarding & Training Assistant

Problem: Long ramp-up time for new employees, especially in complex industries like insurance.

Solution:

- Create a gamified onboarding journey with quizzes, simulations, and scenario-based learning.
- Use AI to personalize learning paths based on role and performance.
- Integrate with internal knowledge bases and case management systems.

OutSystems Features: UI-rich app with gamification components, role-based access.

AI Use: Adaptive learning, chatbot for Q&A, NLP for summarizing policy documents.

3. Customer 360° Intelligence Dashboard

Problem: Fragmented customer data and lack of insights for new customers.

Solution:

- Aggregate internal and public data (e.g., demographics, crime stats, property info).
- Visualize customer profiles with AI-generated insights and risk scores.

- Enable sales or support teams to quickly understand customer context.

OutSystems Features: Data integration, dashboards, role-based views.

AI Use: Data enrichment, entity recognition, geospatial analysis.

4. Compliance & Cybersecurity Monitoring Hub

Problem: Real-time compliance and threat detection is complex and manual.

Solution:

- Build a centralized dashboard for compliance status and security alerts.
- Use AI to detect anomalies in system logs and flag potential threats.
- Automate compliance reporting and audit trails.

OutSystems Features: Real-time data feeds, alerting system, audit logs.

AI Use: Anomaly detection, log analysis, compliance rule engines.

5. Cross-Divisional Knowledge Sharing Platform

Problem: Siloed knowledge in decentralized organizations.

Solution:

- AI-curated knowledge hub that recommends best practices and reusable assets.
- Smart search across documents, emails, and project notes.
- Collaborative spaces for sharing innovations and lessons learned.

OutSystems Features: Document management, collaboration tools.

AI Use: Semantic search, summarization, recommendation engine.

6. AI-Driven Post-Mortem & Incident Management Tool

Problem: Inefficient incident resolution and follow-up.

Solution:

- Automate incident logging, root cause analysis, and post-mortem documentation.
- Use AI to suggest similar past incidents and resolutions.
- Track MTTR and generate improvement insights.

OutSystems Features: Workflow automation, reporting, integration with monitoring tools.

AI Use: Pattern recognition, NLP for incident summaries.

7. Regulatory Navigator for Engineering Projects

Problem: Complex, market-specific compliance requirements.

Solution:

- Build a wizard-like app that guides engineers through regulatory steps.
- Use AI to extract and summarize relevant regulations from documents.
- Tailor guidance based on project type and market.

OutSystems Features: Form-based workflows, document upload, role-based logic.

AI Use: Document classification, summarization, rule-based logic.

Would you like help prototyping one of these ideas in OutSystems or generating a pitch deck or demo flow for the hackathon?

Based on the new set of responses, here are **fresh and targeted app ideas** you could build using **OutSystems + AI** to address real-world business-critical challenges in **onboarding, recruitment, supply chain, and customer service**—all while focusing on **speed, scalability, and cost-efficiency**:

1. AI-Powered Preboarding & Onboarding Journey Builder

Problem: Manual, inconsistent onboarding across departments and subsidiaries.

Solution:

- A low-code app that creates **personalized onboarding journeys** based on role, location, and department.
- Includes AI-generated training plans, welcome messages, and task checklists.
- Tracks engagement and progress with dashboards for HR and managers.

AI Features:

- NLP to summarize policies and training materials.
 - Sentiment analysis on feedback to improve onboarding experience.
-

2. Recruitment Copilot for Hiring Managers

Problem: Manual CV screening and interview coordination.

Solution:

- AI assistant that **ranks CVs** based on job description and past hiring patterns.
- Suggests **interview questions** tailored to candidate profiles.
- Automates interview scheduling and feedback collection.

AI Features:

- Transparent AI model with explainability (e.g., why a CV was ranked high).
 - GPT-powered question generator and candidate summary.
-

3. Smart Logistics & Route Optimization Hub

Problem: Manual, inefficient logistics and load/discharge operations.

Solution:

- AI-driven route planner that optimizes delivery paths based on traffic, weather, and load constraints.
- Automates booking, invoicing, and load planning workflows.

AI Features:

- Predictive ETA and load balancing.
 - Anomaly detection in delivery patterns.
-

4. Dynamic Supply Chain Forecasting Simulator

Problem: Balancing supply, production, and inventory with fluctuating demand.

Solution:

- Interactive app where users can **simulate different supply chain scenarios**.
- Set preferences (e.g., stock levels, lead times) and get AI-generated forecasts.

AI Features:

- Time-series forecasting for demand and supply.
 - Optimization engine to suggest best inventory strategies.
-

5. Customer Service Workflow Visualizer

Problem: Manual, fragmented customer service processes with low automation.

Solution:

- Visual workflow builder that maps current processes and highlights inefficiencies.
- Automates order handling, escalations, and customer follow-ups.

AI Features:

- Process mining to discover how workflows actually operate.
 - KPI tracking and anomaly alerts.
-

6. Knowledge Transfer & Upskilling Assistant

Problem: Knowledge gaps and slow upskilling.

Solution:

- AI chatbot that answers internal questions, recommends training, and connects employees to experts.
- Tracks learning progress and suggests next steps.

AI Features:

- Semantic search across internal documents.
 - Personalized learning paths based on role and performance.
-

Would you like help wireframing one of these apps, generating a demo flow, or even building a prototype in OutSystems?
